ASK STATFLOW

“Explain why onboarding score is significant, in plain English.”

ANALYSIS PLAN

- O1 Verify model specification
- O2 Inspect effect and uncertainty
- O3 Translate into practical impact

VERIFIED COMPUTATION · DEMO DATA

OR 1.42× | 95% CI 1.18-1.71 |
p<.001

What this means

Users with higher onboarding completion scores are meaningfully more likely to remain active after 90 days. The estimated effect is precise enough that random sampling variation is an unlikely explanation.

This is an association, not proof of causation. Account plan and tenure are controlled, but unmeasured motivation may still influence both onboarding and retention.

√ Show Calculation

LIMITATIONS

- Observational data
- Potential omitted-variable bias
- Valid for this customer cohort
